## **Abstract**

As the demand for customized and diverse personal financial products continues to rise, banks are encountering unprecedented opportunities in the personal finance sector alongside intensified competition. Personal financial services now contribute a growing share to banks' overall profits, prompting these institutions to prioritize this area more than ever. Despite this focus, existing research predominantly centers on product comparison, regulatory issues, and risk management. There is a notable gap in studies that propose optimization strategies for commercial banks from a customer-centric perspective, especially those that integrate marketing theory and emphasize local business operations. Taking Bank A as the research object, this paper analyzes the marketing problems of Bank A and discusses the optimization countermeasures from the perspective of customer purchase intention, combined with the research results related to customer purchase intention and personal financial product marketing strategy.

**Keywords:** personal financial products, marketing strategies, purchase intentions

# **1 Introduction**

According to the "2022 Statistical Communiqué on National Economic and Social Development" released by the National Bureau of Statistics, China's per capita GDP has reached 12,700 US dollars in 2022. Compared with 1982, in just 40 years, China's per capita GDP has risen by more than 60 times. With the continuous growth of residents' income, the increase of personal disposable income, and the accumulation of family wealth, residents' demand for investment in personal financial products has become increasingly urgent. As an asset allocation method with a low rate of return, customers' enthusiasm for investment is declining, and with the intensification of the homogenization of the financial product market, people's return on investment and demand for personal financial products are increasing. Many residents are willing to buy personal financial products, but they do not know how to choose the purchase channel. When choosing personal financial products for the first time, banks, as traditional financial institutions, have become the first choice of residents. In order to adapt to the changes in the market environment, in recent years, banks have not only focused their financial services on high-net-worth consumers, but also enriched the types of financial products and provided customers of all walks of life with personal financial products with low thresholds, convenient transactions and strong liquidity, so as to increase customers' property income.

The personal financial business income of banks in developed countries can account for 30%-50% of the overall income, but China has not yet reached this level and there is still room for improvement. Since 2020, the regulators have gradually tightened the control of the quality of bank financial products, and the interest rate difference between deposits and loans has gradually decreased, so banks have also paid more attention to the business of the personal financial sector, and accelerated the development of online personal financial products while promoting the optimization of the structure of personal financial products. With the introduction of new regulations on asset management and other policies and the development of the personal financial product market, banks are facing the situation of homogeneity of personal financial products, small service differences, and similar marketing

strategies, resulting in fierce competition among banks.

In recent years, with the continuous development of the Internet, traditional financial products and purchase channels can no longer meet the financial needs of bank customers. The state has issued a number of policy documents for the banking industry, which provide guidance and suggestions for standardizing the development of banks' personal financial business and promoting the healthy and orderly development of China's personal financial product market. For example, in 2015, ten ministries and commissions jointly issued the "Guiding Opinions on Promoting the Healthy Development of Internet Finance", which put forward the overall requirements for encouraging financial innovation and promoting the healthy development of Internet finance. In 2019, the national "14th Five-Year Plan" encouraged residents' funds to flow into the capital market; In 2022, the State Council issued the "14th Five-Year Plan for the Development of the Digital Economy", which clearly puts forward the requirements of innovation leadership, data empowerment, accelerating the optimization of information network infrastructure, and making digitalization more inclusive. Moreover, studies on the marketing strategies of personal financial products rarely focus on customers' subjective purchase intentions. Exploring this perspective can offer fresh insights and innovative approaches to marketing strategy research.

The practical significance of this study is to study the willingness of Zhejiang residents to purchase personal financial products of banks, so as to provide suggestions for banks to optimize marketing strategies according to the needs of residents. The practical significance is manifested in the following three aspects: First, promote the differentiated marketing of banks' personal financial products. It is hoped that through this survey, we can understand the demand for residents' personal financial products and their real purchase intentions, so as to achieve differentiated product marketing; Second, make a breakthrough in the marketing strategy of personal financial products. By analyzing factors that have affection on purchase intention, combining purchase intention and marketing strategy, we can formulate a marketing strategy that is "pleasing to hear" rather than "stale". Third, improve the customer perception experience. Through questionnaires, customer satisfaction with products, systems, and activities is investigated, and corresponding optimizations are carried out to improve customer perception experience.

## 2 Literature review

Scholars have conducted many studies on the current situation of banks' personal financial products, which can be summarized as follows:

The phenomenon of product homogenization is serious and the innovation is insufficient. Zhang Yiyuan (2019) took the credit products of Qingdao Rural Commercial Bank as the research object, analyzed the reasons for product homogenization, and believed that it was caused by the unclear market positioning of banks. Hui Ruoxu (2020) believes that the key to solving homogenization is to match differentiated products to customers. It is believed that different customers have different needs, and differentiation can help banks retain customers on a larger scale. Zhu Feng (2021) also holds a similar view, and believes that the key to solving homogenization is product innovation.

Scholars have studied the marketing trends of personal financial products and summarized them as follows:

The first trend is that satisfying customer needs has become the main way of marketing for banks. In the 50s of the 20th century, Professor Neil Boden (1953) pioneered the concept of marketing mix, pointing out that market demand will be affected by marketing elements. In 1960, Professor Jerome McCarthy summarized and classified the elements of marketing and formed the 4P theory, and Western commercial banks gradually began to combine the 4P, 4C and other theories to pay attention to customer needs. In the 21st century, the perspective of studying customer needs is more refined. Zhang Yujing (2022) and other scholars proposed that customer portraits and customer requirements for products should be accurately grasped, and it is suggested that information entropy should be used to reduce and cluster analyze customer attributes to make the research conclusions more accurate. Mustafa (2022) analyzed the relationship between customer purchase behavior and customer loyalty through a questionnaire, and proposed that customer loyalty should be paid attention to. Pan Li (2019) said that in order to improve customer satisfaction, the level of banking services can be improved by using customer commitment, brand loyalty, and experiential marketing.

The second trend, the use of big data and digitalization to drive marketing, is gradually becoming a new trend. At the beginning of the 21st century, the Internet has developed

rapidly, and Philip Kotler, a professor at Northwestern University in the United States and the godfather of modern marketing, took the lead in proposing the theory of digital marketing. He believes that 1.0 is product-centric, 2.0 is consumer-oriented, and 3.0 is value-driven, and now in the 4.0 era, it should be based on digitalization, with interaction, community and big data as marketing tools, and shift the marketing center to active interaction and respect for consumers. Chinese scholar Chen Qi (2021) also studies the theory of digital business marketing of banks. In the same vein, he also believes that customers are important players in digital marketing. The difference is that he found that in addition to customers, fintech companies are also important participants. Chen Bangqiang (2021) analyzed the pain points in digital transformation with small and medium-sized banks in China as the entry point, and proposed to put an end to the take-it-or-leave-it, implement the characteristics of the application level, integrate technology empowerment into various business fields in the front, middle and back offices, and improve the digital level by continuously upgrading the infrastructure and underlying systems.

### **3 Development of the Research Model and Hypotheses**

#### **3.1 Model building**

In the previous chapters, this study reviews the influencing factors and research results of consumers' purchase intention at home and abroad, and summarizes several different types of consumer purchase decision theories and mechanisms. Due to the tedious and difficult empirical work of this study at the macro level, this study analyzes consumers' purchase intention from a micro perspective based on the specific research target groups. In order to enable the model to better explore and interpret the purchase intention of bank customers in the face of personal financial products, based on previous research, this study draws on the perception theory and behavioral finance theory on the basis of the technology acceptance model, and proposes six influencing factors that affect purchase intention, namely perceived ease of use, perceived usefulness, product comparative advantage, perceived risk, user experience and satisfaction, and involvement.

## 3.2 Research hypotheses and scale construction

### (1) Perceived ease of use and perceived usefulness

Perceived ease of use and perceived usefulness first appeared in the TAM model, and perceived ease of use is used to measure how easy it is for consumers to use a certain product. Perceived usefulness refers to the degree to which a customer feels that their needs are being met during use. The TAM theory suggests that perceived usefulness and perceived ease of use jointly affect consumers' behavioral attitudes, perceived usefulness can directly act on behavioral intentions in specific situations, and perceived usefulness will be affected by external factors such as image and job relevance. For bank financial products, ease of use is mainly measured by the convenience of the operation process of purchasing the bank financial products. Personal financial products are different from general products in that they have the particularity of financial products, namely returns, liquidity, risk, and functionality. Customers usually consider these financial attributes before purchasing personal financial products. Perceived usefulness measures whether a product can achieve the purpose of wealth growth under the same circumstances. According to the literature review compiled above, the interest rate of the product and whether there are alternative products will have an impact on the purchase intention, usually the higher the interest rate, the higher the customer's purchase intention, and if there is a substitute, the customer is likely to reduce the purchase intention. Liu et al. (2022) found that perceived usefulness and perceived ease of use have a significant positive impact on individuals' willingness to use online banking. Based on this, the following hypotheses are proposed:

H1: Perceived ease of use has a positive impact on customers' willingness to purchase Bank A's financial products

H2: Perceived usefulness has a positive impact on customers' willingness to purchase Bank A's financial products

### (2) Product comparative advantages

As a financial wealth management product, customers will definitely compare the financial products of multiple banks when purchasing, so as to choose more advantageous products. The bank's financial wealth management products are usually the easiest investment channel

for customers to choose, and the investment products of other platforms usually have a high threshold, and customers will choose products with a low starting point, many investment products and high flexibility from several banks they know. Based on this, the following hypotheses are proposed:

H3: The comparative advantage of Bank A's personal financial products is positively correlated with customers' purchase intentions

### (3) Perceived risk

Perceived risk usually refers to the various types of uncertainty risks that consumers worry about in their purchasing decisions. When customers make purchases through online platforms, they will enter their ID numbers, phone numbers, bank card numbers, etc. Once there is a breach in the bank's security system, there is a chance that the customer's private information will be leaked. Bank financial products include a variety of investment forms, investment returns and risks are proportional, any financial products have a certain risk, can not guarantee the absolute return of customers. Through the literature review part, it can be seen that the perceived risk can affect the customer's purchase intention. In addition, by sorting and summarizing various models, it is found that there is a correlation between perceived risk and purchase intention. For example, in the research related to innovation diffusion theory, researchers use perceived risk as an explanatory variable to analyze the impact of perceived risk on customer behavior and customer purchase intention, and the results show that perceived risk has a significant negative impact on customer intention, and this view is widely recognized by scholars (Zhan Jing et al., 2023, Ren Junling, 2019). Based on this, the following hypotheses are proposed:

H4: Perceived risk has a negative impact on customers' willingness to purchase Bank A's financial products

### (4) User experience and satisfaction

Professor Dardozo introduced user satisfaction into the field of marketing research in 1965, and he proposed that if consumers are satisfied with their purchase behavior, then this satisfaction will again motivate them to make a purchase, and a good shopping experience or shopping environment will bring a certain degree of satisfaction to the consumer's psychology and promote the purchase decision. With the continuous development of society,

in order to better meet customer needs and customer experience, banks are also innovating and trying to provide customers with diversified marketing, specialized app software and better services. Ding Mengyue (2021) concluded through empirical analysis that multiple dimensions of experience in the shopping process will have a positive impact on consumers' purchase intention. Based on this, the following hypotheses are proposed:

H5: User experience and satisfaction have a positive impact on customers' willingness to purchase Bank A's financial products

#### (5) Involvement

Involvement is used to study the psychological state of a customer, which is usually influenced by the customer's intrinsic needs, interests, and values. In the process of customer purchase decision-making, scholars analyze customers' purchase intention by studying customer behavior, and they generally believe that no matter how involved they are, it will affect their purchase intention. Qi Yongzhi (2021) found that customer engagement can re-increase customer purchase intention, and customers with high involvement will actively collect product information and conduct a large number of pre-purchase evaluations, and seek maximum expected satisfaction by going through a more complex decision-making process than customers with low involvement. At the same time, a higher engagement level can reflect customer motivation and brand loyalty, while a lower engagement level may lead to customer churn. According to the previous literature review, there is a correlation between involvement and purchase intention. Based on this, the following hypotheses are proposed:

H6: User involvement has a positive impact on customers' willingness to purchase Bank A's financial products.

This paper aims to explore the factors influencing Bank A's customers in purchasing personal financial products, focusing on their purchase intentions. The questionnaire is structured into three sections. The first section provides an introduction and overview of the survey, outlining its purpose and intended use. This is designed to help respondents feel at ease and provide honest answers. The second section gathers demographic and background information from respondents, including gender, education, income, assets, occupation, and other relevant data, which forms the basis for descriptive statistical analysis. The third part of the questionnaire is an important part of this questionnaire, which constructs observation

indicators from six dimensions: perceived ease of use, perceived usefulness, perceived risk, comparative advantage, user experience and satisfaction, and involvement, aiming at the influencing factors of personal financial product purchase intention.

Tab. 3- 1 Variables and reference sources

| variable                    | numbering | Measure the items                                                                                                              | Reference Sources: |
|-----------------------------|-----------|--------------------------------------------------------------------------------------------------------------------------------|--------------------|
| Perceived Ease of Use (PE). | PE1       | In my opinion, Bank A has a wide selection of financial products, and you can buy products that meet your needs at any time    | Davis (1989)       |
|                             | PE2       | I think Bank A's app is very easy to use                                                                                       |                    |
|                             | PE3       | In my opinion, Bank A's system is easy to operate and takes less time and effort                                               |                    |
| (PU)                        | PU1       | I think Bank A's personal financial products are helpful for my personal wealth management                                     | Davis (1989)       |
|                             | PU2       | In my opinion, Bank A can increase the return on personal assets                                                               |                    |
| Comparative advantage (CA). | CA1       | Compared with other banks' personal financial products, Bank A has more choices of products and is more convenient to purchase | Liu Zhizhi (2019)  |
|                             | CA2       | Compared with other banks, Bank A's app will push more useful investment information                                           |                    |
|                             | CA3       | Compared with other financial products, Bank A's financial products have more advantages                                       |                    |

| Risk (PR).                        |      | personal privacy information                                                                 | Cox (1967)                                            |
|                                   | PR2  | I'm worried that Bank A will leak my personal transaction data                               |                                                       |
|                                   | PR3  | I am worried that Bank A's investment return is low, and it will even bring the risk of loss |                                                       |
|                                   | PR4  | I'm worried that Bank A has high transaction fees                                            |                                                       |
| Experience and satisfaction (SE). | SE1  | In my opinion, Bank A's financial products are more personalized                             | Oliver (1980)<br>Wang et al. (2020)<br>Lin Tao (2019) |
|                                   | SE2  | In my opinion, the APP operation interface of Bank A is more designed                        |                                                       |
|                                   | SE3  | I think I'm open to marketing related to financial products                                  |                                                       |
|                                   | SE4  | I think that the activities and products of Bank A's point mall are very useful              |                                                       |
|                                   | SE5  | I think that Bank A's after-sales service can provide me with a good user experience         |                                                       |
| Degree of Involvement (PII).      | PII1 | I usually pay attention to the dynamics of Bank A                                            | Zaichkowsky (1985)                                    |
|                                   | PII2 | I usually log in to Bank A's app regularly                                                   |                                                       |
|                                   | PII3 | I would love to participate in Bank A's activities                                           |                                                       |

The study variables and related theoretical references are shown in Table 3-1. After reading a large number of domestic and foreign literature on the influencing factors of purchase intention, the author constructed the initial questionnaire questions, and further revised them after listening to the suggestions of experts and mentors, and finally formed a relatively complete questionnaire. The main part of the questionnaire uses a five-level Likert scale, where 1 is "strongly disagree"; 2. Indicates "disagree"; 3 means "general"; 4 means "agree"; 5.

"strongly agree", asking the respondents to choose the degree that best suits their own situation according to their real feelings and actual situation.

## **4 Factors Influencing Personal Financial Products' sales by Banks**

### **4.1 Introduction to Bank A**

Founded in September 1996, Bank A has been serving small and medium-sized enterprises and urban and rural residents since its establishment, and is committed to providing customers with professional, convenient and friendly financial services. Now it has developed into a local commercial bank with good asset quality, excellent operating performance and certain comprehensive strength. In recent years, Bank A has won the honorary titles of "Best City Commercial Bank" and "Top 10 Commercial Banks in China for Supporting the Development of Small and Medium-sized Enterprises". At present, it is actively focusing on six business development strategies, accelerating the transformation to a "light, new, refined and cooperative" quality bank, and is committed to enhancing its core competitiveness and building a value-leading bank. The main branches of the bank are set up in Zhejiang, and currently have 10,456 employees, including 1,707 management posts, 1,433 technical posts and 7,316 business posts. In terms of employee education, there are 2,036 people with master's degree or above, accounting for 19%; 7,837 had bachelor's degrees, accounting for 75%; There are 583 people with other academic qualifications, accounting for 6%. Bank A is a listed commercial bank, and the highest decision-making body is the general meeting of shareholders, which makes the final decision on all major matters that determine the operation and management of the bank. The Board of Directors, the Board of Supervisors, senior management and internal organizations operate independently to jointly promote the operation and development of the Bank.

## **4.2 An overview of the current marketing status of Bank A's personal financial products**

### **4.2.1 A basic introduction to Bank A's products**

Bank A's definition of personal financial products is: relevant products provided to individual retail customers. Banks classify personal financial products into four major sections, namely: consumer credit products, savings deposit products, wealth management products, and bank card products.

### **4.2.2 Analysis of the current situation of Bank A's marketing**

(1) The willingness to purchase personal consumption loan products has declined

In 2018, the number of banking institutions in Zhejiang Province accounted for 5.85% of the country's total, but the balance of loans accounted for 8.03% of the country's total, indicating that Zhejiang Province has a strong demand for loans and funds, so banks should pay attention to residents' loan needs and provide loan products in a timely manner. At present, the star products of Bank A's consumer credit mainly include "Rooster Loan" and "Magpie House", and the product types are personal consumption loans and housing loans respectively. In terms of business structure, from 2018 to 2023, housing loan products contributed the most to the business scale, accounting for about 40%, while the proportion of personal consumption loan products showed a downward trend, and as of 2023, it has dropped to the lowest level in the past five years, as shown in Figure 4-1; In terms of product sales, the total loan balance of "Magpie House" will reach 83.2 billion yuan in 2023, an increase of 11.4%, but the total loan balance of the personal consumption loan product "Rooster Loan" will only be 44.6 billion yuan, and the growth rate is significantly lower than that of "Magpie House", which is only 8.1%. These two products are the main products of banks, but the growth rate is very different. In addition, the growth rate of "rooster loan" will reach 63%, which is lower than the growth rate of 36.6% in 2021, indicating that the growth rate of the "rooster loan" business has slowed down in recent years, and it also indicates that customers'

willingness to buy has declined; In 2021, each article had about 10,000 reads and more than 2,000 likes, but in 2022, there were only about 6,000 reads and only about 700 likes, and in 2023, the number of reads per article will decrease to about 3,000, and the number of likes will be less than 500. It can also indicate that customers pay less attention to the product and lower their willingness to buy.

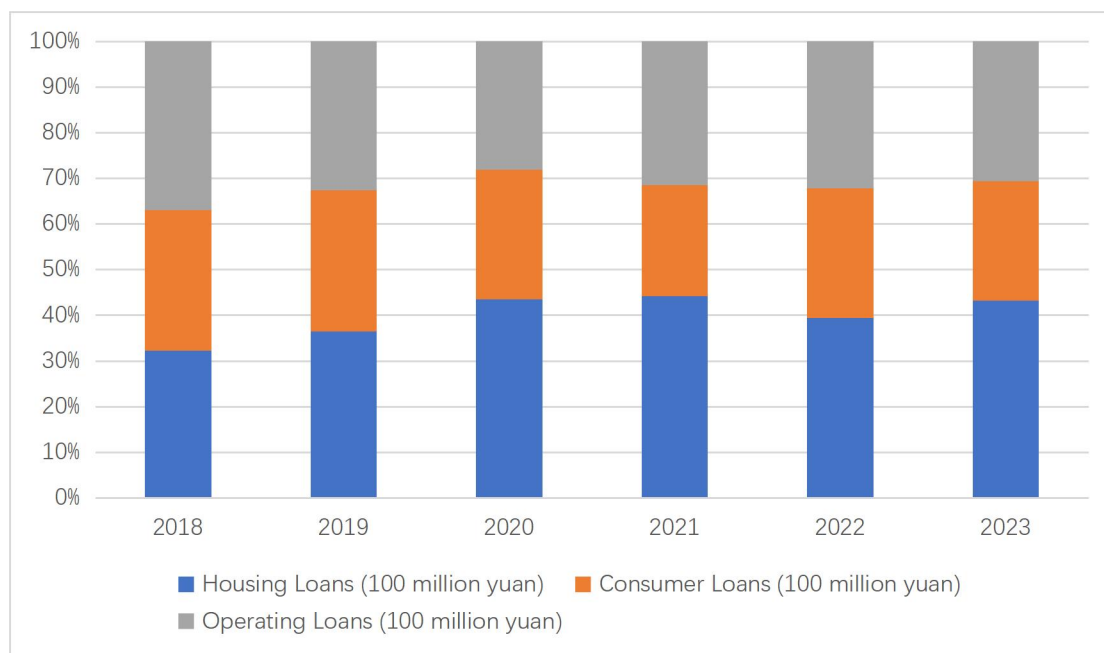

Fig. 4- 1 Consumer credit business structure from 2018 to 2023

## (2) The willingness to purchase savings deposit products is not strong

In terms of business scale, the scale of bank savings deposit business was 74.7 billion yuan in 2018 and 130.7 billion yuan in 2023, and the scale has continued to grow for many years. The growth of savings deposit business from 2016 to 2021 is shown in Figure 4-2.

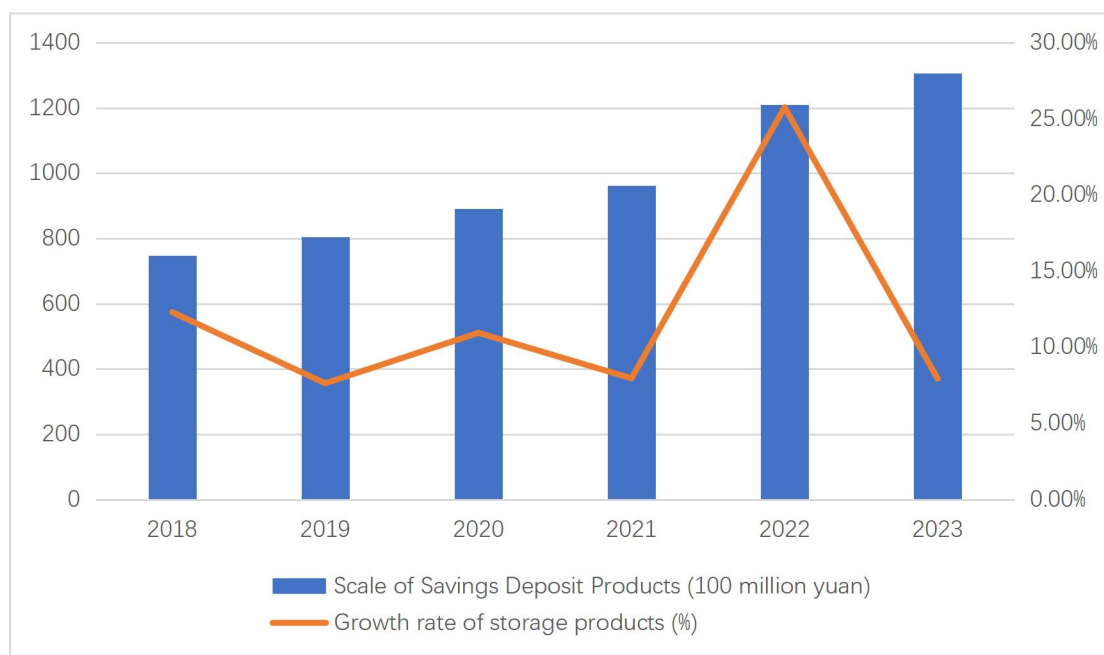

Fig. 4-2 2018-2023 savings deposit business scale

In terms of business growth, savings deposit products can continue to grow, indicating that customers have a certain degree of recognition and purchase willingness to buy products, but the growth rate does not have continuity but fluctuates, which to a certain extent indicates that customers are not willing to buy. In terms of business structure, the business proportion of savings deposit products showed a downward trend. In 2018, it accounted for 20.3%, in 2020 it was only 17.2%, and although it recovered to 18.6% in 2021, it fell back to 17.4% in 2022 and 16.9% in 2023, as shown in Figure 4-3.

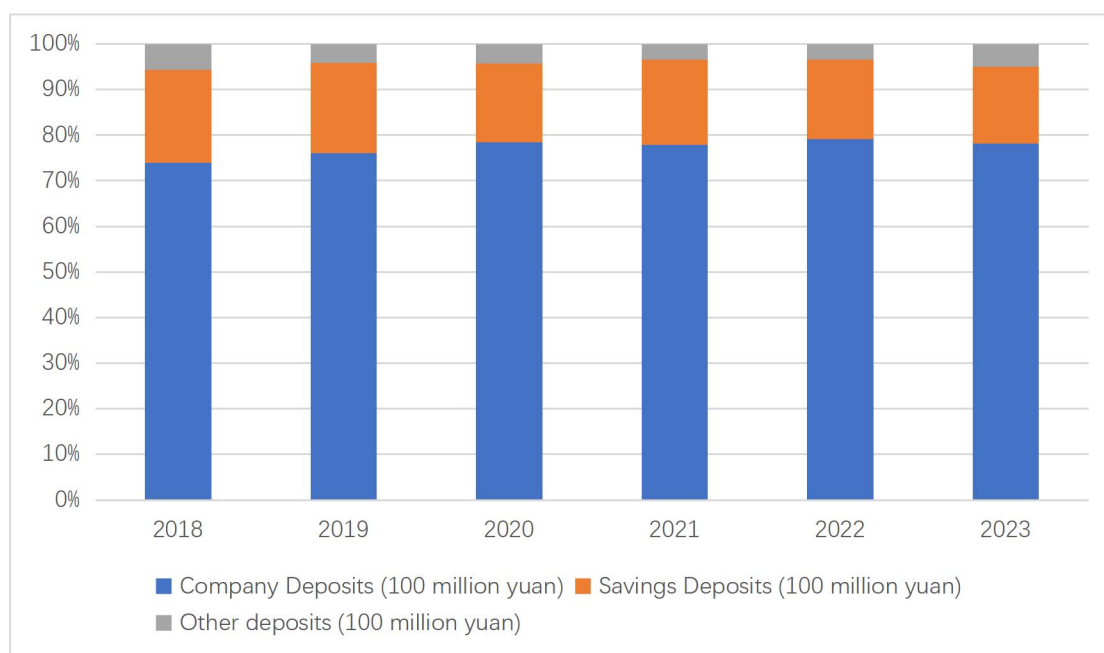

Fig. 4-3 2018-2023 Savings Deposit Business Structure

(3) The willingness to purchase wealth management and credit card products is not high

In the process of purchasing bank wealth management products and applying for credit cards, there are problems such as lengthy processes and cumbersome review. Wealth managers mainly use the offline business model to conduct door-to-door processing, which is relatively long and the qualification review is relatively strict, which greatly affects the efficiency of business processing. Therefore, to a certain extent, the customer's time is delayed, and it is easy to cause customer loss. In terms of handling business, the customer needs to complete a more detailed risk assessment, and the whole process requires the wealth manager to use the customer's ID card, bank card and other documents for on-site review. Most of the competing banks can realize online risk assessment and online qualification review, but Bank A's online system is slow to build and cannot smoothly realize these functions, and the system often has problems, and the higher processing cost will reduce the customer's willingness to buy. In terms of article reading, the average reading volume of credit card articles has continued to decrease in recent years, with more than 30,000 per credit card article in 2021, only about 18,000 in 2022, and about 9,000 per article in 2023. It can indicate that customers pay less attention to bank credit card products and are less willing to buy. Comprehensive analysis shows that customers are not willing to purchase wealth management and credit card products.

## 4.3 Preparation of questionnaires

### 4.3.1 Survey Respondents

This paper studies the customer's willingness to purchase personal financial products of Bank A, and since Bank A is a local bank in Zhejiang, the research work was carried out in Zhejiang, and the respondents are not limited to the groups that have purchased personal financial products in Bank A, but also include the groups that have not purchased products in Bank A. By studying the main influencing factors of purchase intention, this paper provides a reference for the optimization and implementation suggestions of banks' personal financial product marketing strategies. First of all, the per capita disposable income of Zhejiang

Province has increased year by year from 2017 to 2023, and the per capita disposable income has increased from 38,537 yuan to 67,541 yuan, indicating that the disposable income of residents in Zhejiang Province continues to grow, so theoretically speaking, the funds available for purchasing personal financial products will also increase; Secondly, the Statistical Communiqué on the National Economic and Social Development of Zhejiang Province shows that compared with 2017, the balance of deposits and loans in local and foreign currencies of financial institutions in Zhejiang Province will increase by 17.98 trillion yuan in 2023, of which the balance of deposits will increase by 825 trillion yuan, the balance of loans increased by 9.93 trillion yuan, indicating that Zhejiang Province's ability to absorb funds continues to improve, and residents' willingness to invest and manage money increases, which are the basis for residents' willingness to buy, but whether residents will use money to buy products is still uncertain, so it is necessary to design a questionnaire to study. Figure 4-4 shows the statistics of the balance of deposits and loans in local and foreign currencies of financial institutions in Zhejiang Province.

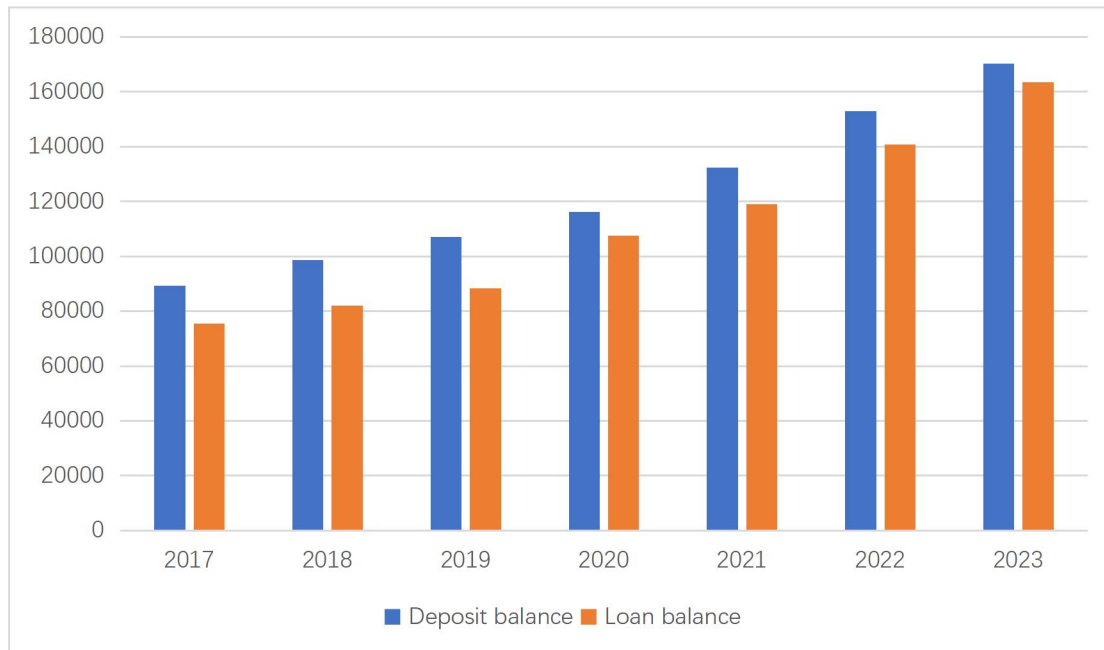

Fig. 4-4 Statistics of Deposits and Loans in Local and Foreign Currencies of Financial Institutions in Zhejiang Province (Unit: 100 million yuan)

### 4.3.2 Questionnaire distribution and collection

In this study, the questionnaire survey was adopted, and the questionnaire was distributed to customers of Bank A, which was forwarded by friends, company leaders and colleagues in Zhejiang to expand the sample size. A total of 750 questionnaires were submitted, and 712 valid questionnaires were obtained. The effective recovery rate of the questionnaire was 94.93%. The sample size was relatively evenly divided into respondents of different genders, occupations and incomes, and the respondents actively filled in on the basis of ensuring authenticity, and there were few invalid questionnaires. This shows that the questionnaire has good randomness and the survey quality is relatively high.

## 4.4 Descriptive statistics

### 4.4.1 Descriptive statistical results

(1) Basic information of the respondent

Tab. 4- 2 Basic information of the respondent

| Characteristic variables   | type                                         | Sample size | Percentage of sample |
|----------------------------|----------------------------------------------|-------------|----------------------|
| Gender of the customer     | man                                          | 365         | 51%                  |
|                            | woman                                        | 347         | 49%                  |
| Customer's place of origin | Native of Hangzhou, Zhejiang                 | 187         | 26%                  |
|                            | Zhejiang is from Zhejiang, but not Hangzhou  | 369         | 52%                  |
|                            | Non-Zhejiang                                 | 156         | 22%                  |
| Region                     | The provincial capital is Hangzhou           | 475         | 67%                  |
|                            | It is not the provincial capital of Hangzhou | 237         | 33%                  |
| Age of the                 | Under 18 years of age                        | 69          | 10%                  |

|                     |                                               |     |     |
|---------------------|-----------------------------------------------|-----|-----|
| customer            | 19-30 years old                               | 232 | 33% |
|                     | 31-40 years old                               | 299 | 42% |
|                     | 41-50 years old                               | 65  | 9%  |
|                     | 50 years of age or older                      | 47  | 7%  |
| Customer Occupation | Civil servants or public institutions         | 98  | 14% |
|                     | Employees of the enterprise                   | 443 | 62% |
|                     | Business executives                           | 79  | 11% |
|                     | Sole proprietorship                           | 59  | 8%  |
|                     | Retirement or temporary separation            | 33  | 5%  |
| Degree              | Junior high school/technical secondary school | 46  | 6%  |
|                     | college                                       | 204 | 29% |
|                     | undergraduate                                 | 362 | 51% |
|                     | Master                                        | 67  | 9%  |
|                     | Ph.D. or above                                | 33  | 5%  |
| Monthly income      | Less than 5,000 yuan                          | 98  | 14% |
|                     | 5000-10000 yuan                               | 365 | 51% |
|                     | 10,000-20,000 yuan                            | 189 | 27% |
|                     | 20,000-50,000 yuan                            | 47  | 7%  |
|                     | More than 50,000 yuan                         | 13  | 2%  |

The basic information of the respondents is detailed in Table 4-3.

In terms of customer gender, the number of respondents was 365 men, accounting for 51%, and 347 women, accounting for 49%. It can be seen that the majority of the respondents are male. At the level of nationality, 187 respondents were from Hangzhou, accounting for 26%. There were 369 respondents from Zhejiang Province but not Hangzhou, accounting for 52%, with a total of 78%, and the other 22% were from non-Zhejiang Province. At the age level, the customers are mainly between 19 and 40 years old, accounting for 84%. It shows that the

respondents are mainly young and middle-aged, and they also have more attention and interest in the personal financial products of banks. At the level of customer occupations, there is no particularly large number of employees in a certain occupation, with a total of 443 employees, accounting for 62%. The cross-analysis preliminarily shows that the respondents in any occupation have a certain willingness to buy, which indicates to a certain extent that the survey results are objective, but there are still certain differences in the purchase willingness of different groups, and whether they will be affected by different factors is worthy of further study. At the level of customer education, the number of junior high school or technical secondary school accounted for only 6%, and the number of college degree or above accounted for 94%, indicating that the respondents have a certain level of education and the ability to understand the survey questionnaire, so the survey results have a certain degree of credibility. According to the preliminary analysis of the communication results in the survey process, the higher the education level, the more concerned they will be about the preservation and appreciation of their assets. The cross-analysis showed that the respondents with college degree or above had a strong purchase intention, and those with a master's degree had the strongest purchase intention. In terms of customer income, 86% of the respondents have a monthly income of more than 5,000 yuan, have a certain ability to purchase bank products, and also have high wealth management needs. According to the average wage level in the China Statistical Yearbook 2022 of the National Bureau of Statistics, the average monthly wage of urban non-private units in Zhejiang Province is 10,192 yuan, and the average salary of the respondents is basically in line with this range. In addition, the descriptive statistical analysis also summarized the assets of the respondents from Bank A, and 25% of the customers had 0 assets in Bank A, indicating that these respondents were not customers of Bank A, which can show that the surveyed people are not limited to bank customers but also non-bank customers, indicating that the results of the survey questionnaire are objective, and the results can also reflect the purchase intention of two different groups of bank customers and non-bank customers. For bank customers, 17% of the respondents have assets between 0.1 and 100,000 yuan (inclusive), 36% of the respondents have assets between 100,000 and 500,000 yuan (inclusive), 11% of the respondents have assets between 500,000 and 1 million yuan (inclusive), 7% of the

respondents have assets between 100,000 and 5 million yuan (inclusive), and 4% of the respondents have assets of more than 5 million yuan.

## (2) Statistics of questionnaire survey results

In order to make the analysis concise and better show the attitudes of the respondents, the questionnaire was organized and grouped in a cumulative upward manner. Specifically, this paper defines "strongly disagree" and "disagree" in the second part of the questionnaire as "dissatisfied" by the respondents; define "general" and "agree" as "generally satisfied"; Define "strongly agree" as "very satisfied". However, for perceived risk issues, "very satisfied" is defined as not worried, and "dissatisfied" is defined as worried. The results of the questionnaire are detailed in Table 4-3.

Tab. 4- 3 Statistics on the results of the questionnaire

| The type of question   | topic                                          | Very satisfied with the number of people | Generally satisfied with the number of people | Number of dissatisfied people |
|------------------------|------------------------------------------------|------------------------------------------|-----------------------------------------------|-------------------------------|
| Perceiving ease of use | Personal financial products are easy to choose | 643                                      | 40                                            | 29                            |
|                        | The APP is easy to use                         | 426                                      | 159                                           | 127                           |
|                        | The banking system was quickly mastered        | 522                                      | 48                                            | 142                           |
| Perceived usefulness   | Wealth management helps                        | 378                                      | 153                                           | 181                           |
|                        | Personal                                       | 420                                      | 105                                           | 187                           |

|                       |                                                    |     |     |     |
|-----------------------|----------------------------------------------------|-----|-----|-----|
|                       | financial products have better returns             |     |     |     |
| Comparative advantage | Personal financial products are easy to purchase   | 408 | 168 | 136 |
|                       | More useful investment information will be pushed  | 198 | 213 | 301 |
|                       | The product has more advantages and attractiveness | 435 | 90  | 187 |

|                  | The service can provide me with a good user experience | 510 | 129 | 73  |
| Involvement      | I usually care about the dynamics of Bank A            | 351 | 252 | 109 |
|                  | Log in to the Bank A app regularly                     | 501 | 192 | 19  |
|                  | Willingness to participate in Bank A's activities      | 441 | 63  | 208 |

(1) Perceived ease of use

This paper defines perceived usefulness as whether perceived ease of use affects customers' purchase intentions when using banking apps and operating systems, as well as whether the

respondents feel the ease of operation and product selection when using banking apps and operating systems.

Most of the respondents were satisfied with the question of how easy it was to choose personal financial products. 643 people think that there are many choices of personal financial products, accounting for 90%, and only about 4% think that the products are not rich enough to choose their favorite products, which can roughly prove that bank products are more selectable and have been well received by customers; On the question of whether the APP is easy to use, 127 people think that the APP is not convenient enough to use, accounting for 18%, according to the analysis of the follow-up return visit results, the main reasons for the lack of convenience include: the APP life section needs to enter the password every time to receive the exchange coupon, and there are often jams in the process of using the APP. On the question of whether the banking system can be mastered quickly, 522 people think that the system is very convenient to use, and this proportion reaches 73% without considering the educational background of the respondents, but there are also 142 people who think that the bank system is not easy to use, accounting for 20%.

#### (2) Perceived usefulness

This paper defines perceived usefulness as whether the financial information provided by banks is professional and time-sensitive, so as to be helpful for wealth management; and whether the products sold by the bank can enable customers to achieve better returns on their assets, so as to achieve asset preservation and appreciation. On the question of whether banks are helpful for wealth management, 378 people think it is helpful, accounting for 53%; The number of people who were dissatisfied was 181, accounting for 25%. On the question of whether the return on assets can be improved, 420 people are very satisfied, accounting for 59%; The number of dissatisfied people was 187, accounting for 26%. It shows that nearly one-third of the people are dissatisfied with the income of Bank A's products, indicating that some of Bank A's products may not have advantages in terms of income.

#### (3) Comparative advantage

136 people were dissatisfied with the convenience of Bank A's products compared with other banks, accounting for 19%, indicating that some customers generally recognized the convenience of Bank A's products, and their willingness to choose Bank A's products may not

be high compared with other banks. Whether the investment information pushed is more advantageous than other banks, only 198 people think it is useful, accounting for 28%; 301 people thought it was useless, accounting for 42%; In terms of whether financial products have advantages, it can be found that they are not absolutely attractive to some customers. 187 people (26%) were dissatisfied with the question that Bank A's financial products had obvious comparative advantages, indicating that some customers believed that bank products did not have obvious advantages, and their willingness to buy was not high.

#### (4) Perceived risk

According to the actual operation of Bank A, this paper divides the perceived risk into system function risk and financial risk. In terms of system risk, if customers believe that their personal information and transaction data are easily leaked by the bank, there will be a perceived risk of system insecurity; In terms of financial risk, if the product income is unstable or even loss-making, customers' recognition of the bank will be reduced, and the perceived risk will also increase. 273 people were worried about the disclosure of personal privacy, accounting for 38%, which is relatively high. According to the results of the return visit, the main reason is that since purchasing Bank A products, many respondents have received harassing calls from other companies within two months; Worried about low investment returns or even losses, some expressed concern, a total of 270 people, accounting for 38% of the total, indicating that bank products may not have income advantages; Concerned about high transaction fees, only 82 people were dissatisfied.

#### (5) User experience and satisfaction

Since this paper studies the willingness to purchase personal financial products and related marketing strategies of banks, this paper defines user experience and satisfaction as whether customers are willing to experience new products, as well as the degree of acceptance of new things, new products, and new interactive gameplay, and the degree of satisfaction with services. On the question of whether the product is personalized, most people are generally satisfied with the personalization of Bank A's products, with 435 people, accounting for 61%; 26% of respondents believe that the product is not personalized and dissatisfied, 13 percentage points more than satisfied, and the reason for not having personalization is that the respondents believe that Bank A's products are too standardized and homogeneous, and there

is no differentiation compared with the products in the market, so they will not have a high willingness to buy; On the question of whether the APP has a sense of design, 319 people think that it does not have it, accounting for 45% of the total, and the surveyed customers believe that although the APP of Bank A is easy to use, the page looks simple and the operation experience is poor, and there is no fun in the process of use, and the desire to use it cannot be stimulated. In terms of marketing methods, 4,486 people said they were willing to experience the new promotional methods, accounting for 68%, but they also said that they were not satisfied with the bank's existing promotional methods. Therefore, banks should pay attention to the innovation of promotional methods and improve customer experience. On the question of whether the points mall and prizes are interesting, only 168 people think they are interesting, accounting for 24%; 214 people thought it was not interesting, 6 percentage points more than those who thought it was interesting, indicating that the products and activities in the points mall were not attractive to some of the respondents, and the customer's willingness to buy was not high; In addition, 510 people said that Bank A's service was good and could bring them a better user experience, indicating that customers were generally satisfied with Bank A's service, and only 73 people said they were dissatisfied.

#### **(6) Involvement**

In this study, the involvement is defined as whether the respondent actively pays attention to the bank's dynamics, whether he logs in to the bank app regularly, and whether he is willing to actively participate in the activities of Bank A, which is used to observe the stickiness between the respondent and the bank. On the question of whether they will care about bank dynamics, 351 people said that they usually actively care about bank dynamics, accounting for 49%. This part of the people is more involved, and there is a good stickiness between the bank, the bank should actively use it, and there are 66 non-A bank customers in this part of the people, indicating that there are also non-bank customers who care about the bank's dynamics; On the issue of regular login to the APP, 501 people said that they would log in regularly, but regular login does not mean that the degree of involvement is high, and further analysis should be combined with the frequency of login, 208 people are not willing to participate in bank activities, accounting for a relatively high percentage, reaching 29%, which is low in the degree of involvement of the respondents and is susceptible to external

influences, and banks need to increase their attention to them to avoid loss.

#### 4.4.2 Descriptive statistical analysis

This paper establishes a scale for customers' willingness to purchase personal financial products from six dimensions, and establishes a number of measurement indicators. In this section, the second part of the questionnaire will be statistically analyzed in terms of maxima, minimum, kurtosis skewness, etc., and the measurement indicators will be tested to follow the normal distribution. Kurtosis and skewness can be used to describe the distribution of the data, reflecting the degree of skew and taper of the distribution characteristics. As can be seen from the table, the questionnaire results show a good normal distribution as a whole, and there are no extreme values that are too high or too low, and there is no serious skew in the value of a certain variable, which can be analyzed in the next step. See Table 4-5 for detailed inspection results.

In addition, through the survey of questionnaires, 432 people are willing to purchase personal financial products of Bank A, accounting for 60.67%; There were 261 people who were not willing to buy personal financial products from banks, accounting for 36.66%. This data shows that more than sixty percent of the respondents are willing to buy personal financial products of Bank A, but more than three percent of them are unwilling to buy them, indicating that there are still some respondents who are not very willing to buy personal financial products of Bank A, and there is still room for improvement in improving the willingness of customers to buy. Further cross-analysis shows that nearly seventy percent of those who are willing to buy have purchased products, and they have a relatively high degree of recognition of banks, but about thirty percent have not purchased products. There are two main reasons why there is a willingness to buy but does not form a purchase behavior in the end, the first is the lack of purchase funds, and the second is that the customer chooses other bank products after comparison. But in fact, banks should strive for this part of the bank to improve the chances of conversion; Most of the people who are not willing to buy say that the threshold of bank products is too high, their qualifications do not meet the bank's requirements, and they are not interested in banking activities; Some people said that they

had used the available funds to buy stocks or funds due to their investment preferences, while others said that they did not trust Bank A, believing that Bank A was a commercial bank and did not have the credit endorsement of a state-owned bank.

Tab. 4- 4 Descriptive statistical analysis of the questionnaire

| variable | Measurement metrics | Min | Max | M    | SD    |
|----------|---------------------|-----|-----|------|-------|
| PE       | PE1                 | 1   | 5   | 3.82 | 0.897 |
|          | PE2                 | 1   | 5   | 3.84 | 0.907 |
|          | PE3                 | 1   | 5   | 3.88 | 0.898 |
| PU       | PU1                 | 1   | 5   | 3.73 | 0.854 |
|          | PU2                 | 1   | 5   | 3.85 | 0.797 |
| CA       | CA1                 | 1   | 5   | 3.74 | 0.842 |
|          | CA2                 | 1   | 5   | 3.47 | 0.956 |
|          | CA3                 | 1   | 5   | 3.74 | 0.805 |
| PR       | PR1                 | 1   | 5   | 3.39 | 0.840 |
|          | PR2                 | 1   | 5   | 3.42 | 0.824 |
|          | PR3                 | 1   | 5   | 3.60 | 0.817 |
|          | PR4                 | 1   | 5   | 3.51 | 0.858 |
| SE       | SE1                 | 1   | 5   | 3.51 | 0.858 |
|          | SE2                 | 1   | 5   | 3.35 | 0.858 |
|          | SE3                 | 1   | 5   | 3.58 | 0.948 |
|          | SE4                 | 1   | 5   | 3.79 | 0.859 |
|          | SE5                 | 1   | 5   | 2.92 | 0.443 |
| PII      | PII1                | 1   | 5   | 3.38 | 0.846 |
|          | PII2                | 1   | 5   | 3.81 | 0.873 |
|          | PII3                | 1   | 5   | 3.60 | 0.798 |

## **4.5 Questionnaire correlation analysis**

### **4.5.1 Reliability analysis**

Reliability pertains to the consistency of data obtained from a questionnaire. It refers to the extent to which repeated measurements using the same method yield consistent results for the same respondent. A high level of reliability indicates that the measurement is consistent and dependable, whereas a low level suggests inconsistency and instability. In this study, internal consistency reliability was applied to assess the questionnaire's dependability. If the Cronbach's alpha value for any variable was less than 0.60, it was deemed unreliable, implying the need for revision of the questionnaire items. The results of the reliability analysis are presented in Table 4-5.

Tab. 4- 5 Reliability test results

| variable | Cronbach' a |
|----------|-------------|
| PE       | 0.884       |
| PU       | 0.931       |
| CA       | 0.886       |
| PR       | 0.870       |
| SE       | 0.867       |
| PII      | 0.860       |

This study adhered to the recommended Cronbach's alpha standard. If the internal consistency reliability, represented by Cronbach's alpha, fell below the threshold of 0.7, the corresponding variable would be revised promptly. The study results, as displayed in the table, cover six dimensions: perceived ease of use, perceived usefulness, comparative advantage, perceived risk, experience and satisfaction, and involvement. For each variable, the Cronbach's alpha value surpassed the standard threshold of 0.8, confirming that the questionnaire data were highly reliable, thereby enabling the subsequent validity analysis.

#### 4.5.2 Validity analysis

Validity reflects the extent to which a questionnaire accurately measures the intended variable. It can be categorized into three types: content validity, criterion validity, and construct validity. Among these, construct validity is commonly applied in research as it evaluates how well a measurement tool captures theoretical concepts and characteristics. In this study, construct validity was assessed using factor analysis. Specifically, the Kaiser-Meyer-Olkin (KMO) measure and Bartlett's test of sphericity were employed to determine sample adequacy. A KMO value exceeding 0.7 and a significant Bartlett's test result at the 0.05 level indicate that the data are appropriate for factor analysis and are considered reliable and valid. The SPSS results presented in Table 4-6 show a KMO value of 0.968 (greater than 0.7) and a significance level for Bartlett's test of 0.000, confirming the validity of the study.

Tab. 4- 6 KMO and Bartlett test results

|          |          |          |
|----------|----------|----------|
| KMO      |          | 0.968    |
| Bartlett | $\chi^2$ | 6929.079 |
|          | df       | 265      |
|          | p        | 0.000    |

#### 4.5.3 regression analysis

The multiple linear regression model and correlation coefficients constructed in this paper are detailed in Table 4-7.

Tab. 4- 7 Regression analysis results

| model                             | Non-normalization<br>coefficient Beta | T-value | Mr.   | Collinearity<br>statistics<br>VIF value |
|-----------------------------------|---------------------------------------|---------|-------|-----------------------------------------|

| Perceiving<br>ease of use         | 0.291                                 | 5.495   | 0.000 | 7.130                                   |
| Perceived<br>usefulness           | 0.176                                 | 3.683   | 0.001 | 5.805                                   |
| Comparative<br>advantage          | 0.200                                 | 4.529   | 0.000 | 4.940                                   |
| Perceived risk                    | 0.237                                 | 5.228   | 0.000 | 5.243                                   |
| Experience<br>and<br>satisfaction | 0.132                                 | 2.857   | 0.007 | 5.414                                   |
| Involvement                       | 0.334                                 | 5.813   | 0.000 | 1.395                                   |
| Model<br>summary                  | establish                             |         |       |                                         |
| F-number                          | 278.595                               |         |       |                                         |
| P-value                           | 0.000                                 |         |       |                                         |
| R2                                | 0.855                                 |         |       |                                         |
| Adjusted R2                       | 0.851                                 |         |       |                                         |

Linear regression mainly studies whether there is a linear relationship between the

independent variable and the dependent variable, and univariate linear regression analysis can play an important role in solving the problem of single independent variables, but in practical applications, the target quantity is often not only affected by one variable, but often by multiple variables at the same time, at this time, multiple regression analysis must be carried out to know the relationship followed between the variables. Multiple linear regression analysis is the most basic and simplest kind of multiple regression analysis, and the multiple linear regression model must be tested and evaluated to determine whether the model is usable after obtaining the parameter least squares estimate.

First, the degree of fit  $R^2$  is measured, and the change explained by the regression equation accounts for the total change of the dependent variable. A larger  $R^2$  indicates that the regressors fit the sample data better, and that the independent variable is more closely related to the dependent variable. Secondly, the significance test of the regression equation was carried out, and the F-statistic was constructed by ANOVA to see whether the P value was significant. If the recommended standard is less than 0.05, the regression equation is considered to be significant and the regression effect is significant; on the contrary, if the P value is greater than 0.05, the regression equation is not significant and the regression effect is not significant. If the significance p value of the independent variable is less than 0.05, it is considered that the independent variable has a significant impact on the dependent variable, if the regression coefficient is positive, it can be considered as a significant positive effect, and if the regression coefficient is negative, it is a significant negative impact. In summary, this paper uses multiple linear regression statistical methods to add gender, age, monthly income, and education level as control variables to study whether the independent variables such as perceived ease of use, perceived usefulness, comparative advantage, perceived risk, experience, satisfaction, and involvement have a significant impact on the purchase intention of individual financial products, and verify the hypothesis.

The VIF value of the regression model constructed this time is less than 10, which can be considered to be non-collinearity, the variance test statistic F is 278.595, the P value is 0.000, and the independent variables are significant, which shows that the regression model constructed in this paper is reasonable and has certain statistical significance. Eventually, it can be considered to be able to be used for hypothesis testing. Combined with the above

research hypothesis, combined with the six dimensions of perceived ease of use, perceived usefulness, comparative advantage, perceived risk, user experience and satisfaction, and user involvement, the research conclusions are summarized accordingly, and the conclusions are detailed in Table 4-9.

Tab. 4-9 Hypothetical study results validated

| serial number | Research hypothesis                                                                                                       | conclusion  |
|---------------|---------------------------------------------------------------------------------------------------------------------------|-------------|
| H1            | The perceived ease of use has a positive impact on the willingness of customers to purchase Bank A's financial products   | In the tank |
| H2            | The perceived usefulness has a positive impact on the willingness of customers to purchase Bank A's financial products    | In the tank |
| H3            | Comparative advantage has a positive impact on customers' willingness to purchase Bank A's financial products             | In the tank |
| H4            | Perceived risk has a negative impact on the customer's willingness to purchase Bank A's financial products                | In the tank |
| H5            | User experience and satisfaction have a positive impact on customers' willingness to purchase Bank A's financial products | In the tank |
| H6            | User involvement has a positive impact on the willingness of customers to purchase Bank A's financial products            | In the tank |

## 5 Advice on the marketing strategy of Bank A's personal financial products

### 5.1 Advice for optimizing product strategies

The purpose of guiding innovative customers to participate in the development of new products is to help banks break the dilemma of product homogeneity. According to the survey, about 60% of the respondents are willing to experience new marketing methods, and these customers are often innovative, so banks should encourage them to participate in product design to design new products with differentiated advantages.

(1) Guide innovative customers to participate in new product design

Innovative customers refer to the customer groups who participate in innovation in the process of product development and design, and they can help enterprises save costs and optimize products. In the stage of designing new products, we can guide highly innovative and active customers to participate in the whole design process, put forward opinions on product benefits, product names, and visual effects, and adopt and reward excellent opinions; In the commercialization stage, innovative customers should be encouraged to recommend the product, and even help them pay for the recommendation. In addition, they can bring the latest customer demand information and market information in the process of participating in innovation, provide new ideas for product innovation, and design recommendation incentive plans for innovative customers to encourage recommended product behavior.

(2) Develop new products based on the bank's own advantages

The competition in the personal finance business of banks is fierce, so banks often innovate products or systems based on their own advantages. For example, some banks use big data to launch robo-advisory systems to recommend products with a high number of views to customers. Some banks design products according to the needs of the parent company's ecosystem to meet the needs of the group's customers. New product innovation can meet the personalized needs of customers and bring new experiences to customers. Bank A should combine its own advantages and promote the development of new products based on target customers, sales channels and customer needs.

## **5.2 Recommendations for optimizing your promotion strategy**

Bank A's offline promotional activities are mainly combined with monthly festivals to carry out gift promotions, which have problems such as homogeneity and lack of novelty. In fact, the form of promotional activities should be more abundant. Design and guide different types of customers to participate in different activities and obtain different rewards, and the specific promotion strategies are as follows:

(1) Ordinary customers and gold customers

This part of the customer base is large. Through the results of customer behavior analysis, it

can be seen that they pay high attention to the product sector and have a high willingness to purchase savings and deposit products. Therefore, it can take a similar combination of promotions and offers. For example, when customers purchase personal financial products up to a certain amount, they can enjoy discounts or give double mall points; It can also guide these customers to apply for credit cards, so that they can enjoy activities such as credit card bill installment, fee reduction, and double points for high-frequency credit card consumption customers. Enhance customer stickiness by increasing the purchase frequency of regular customers and gold customers.

## (2) Platinum customers and diamond customers

The sectors that this part of the client pays the most attention to are the information sector and the equity sector, and they pay more attention to professional information articles and high-end rights and interests. For this part of the customer, we can provide research reports and professional investment articles. At the same time, high-end cocktail parties and high-end salons are held, because high-end customers often attach great importance to service quality, and the better the service quality, the higher the customer trust. Holding regular high-end cocktail parties and salons not only improves the bank's image, but also helps retain customers. At the same time, it can provide unlimited airport VIP services, green channels for medical treatment, lawyer consultation, tax law consultation and other services.

## 5.3 Advice for optimizing service policies

After the service is completed, Bank A shall pay a return visit to the customer and guide the customer to fill in the "Service Perception Return Visit Form" to understand the service satisfaction and whether there is any perceived risk in the service process from the customer's subjective perspective. In the design of the perceived value table, the constituent elements should include: product value, service value, emotional value, perceived risk and other key indicators, and customer feedback should be analyzed from multiple perspectives. Wealth managers also need to patiently guide customers to fill out questionnaires based on real ideas, so as to judge customer needs and lay the foundation for follow-up services and purchase intentions. For details about the design dimensions of the service-aware return table, see

Table 5-1.

Tab. 5- 1 Service-aware return table

| Dimension division           | Return visit elements                      |
|------------------------------|--------------------------------------------|
| Product value evaluation     | Product richness                           |
| Product value evaluation     | Product innovation                         |
| Product value evaluation     | Ease of product purchase                   |
| Service value evaluation     | Quality of staff service                   |
| Service value evaluation     | The business environment of the branches   |
| Sentimental value evaluation | Number of Wealth Manager Contacts          |
| Sentimental value evaluation | Communication Emotions for Wealth Managers |
| Perceived risk assessment    | Risk of information breach                 |

## 5.4 Advice for channel strategy optimization

### 5.4.1 Strengthen channel integration

The purpose of channel integration is to synchronize the advantages of banks in online and offline, including offline channel construction and online channel construction. In terms of the construction of offline channels, we will optimize the layout of outlets, accelerate the pace of branch construction, pay attention to the construction of third-party agency channels, and continuously complete the construction of characteristic outlets, so that the marketing and service positioning of bank outlets will be further clarified, and the management and organizational structure will be optimized. The second is the construction of online channels, and the development of online channels will be synchronized with the development of science and technology, which is an inevitable trend of development. The focus should be on the construction of online banks and online official accounts, so that service channels and online networks can gradually take on a networked and three-dimensional form, highlighting the advantages of online, and at the same time, further expanding the boundaries of personal financial business and filling the problem of insufficient coverage of offline outlets.

## 6 conclusion

First of all, with the increasing demand for personalized and diversified personal financial products, the personal financial business of banks has ushered in unprecedented development prospects. However, this has also led to increasing competition among banks. The proportion of personal financial business income in bank profits is gradually increasing, making banks pay more and more attention to it. In this context, it is particularly important to study the personal financial products of commercial banks, especially from the perspective of customers, and put forward optimization strategies combined with marketing theory.

Taking Bank A as the research object, this paper analyzes the marketing problems of Bank A through the analysis of customers' purchase intentions, as well as the analysis of the current situation of Bank A's operation and customers' willingness to purchase personal financial products, and puts forward corresponding optimization countermeasures. Our research not only enriches the theoretical achievements in this field, but also provides practical guidance for Bank A and other similar financial institutions.

Overall, the purpose of this paper is to provide some practical recommendations for Bank A to optimize the marketing strategy of its personal financial products, increase customers' purchase intentions, and thus increase the bank's revenue. It is hoped that these results will provide a useful reference for further research in related fields.

## appendix

Bank A's customer satisfaction research questionnaire

Dear Sir/Madam, Hello!

First of all, thank you very much for taking time out of your busy schedule to participate in this survey. This questionnaire is an academic research questionnaire designed for graduate students, and the answers to the questionnaire should reflect your real thoughts. This survey is conducted anonymously, and the data is only for scientific research purposes and will not be released to the public.

Part 1: Basic Individual Information (Please select the situation that you think is most acceptable to the actual situation and mark it with "√".) )

1. Gender:

A. Male B. Female

2. Your place of origin is:

A. Native of Hangzhou, Zhejiang B. Native of Zhejiang but not Hangzhou C. Non-native of Zhejiang

3. Your region is:

A. Hangzhou, the provincial capital

B. Hangzhou, which is not the provincial capital

3. Your age:

A. 18 years and under B. 19-30 years old C. 31-40 years old D. 41-50 years old E. Over 50 years old

4. What is your occupation:

A. Civil servants or public institutions

B. Employees of the enterprise

C. Business executives

D. Individually-owned businesses

E. Retirement or temporary separation

5. Your Educational Background: Education:

- A. Junior High School/Technical Secondary School
- B. Tertiary College
- C. Undergraduate
- D. Master's degree
- E. Ph.D. or above

6. Your monthly income range is:

- A. Less than \$5,000
- B. 5,000-10,000 RMB
- C. 10001-20000 元
- D. \$20,001-50,000
- E. More than 50,000 yuan

7. Have you purchased financial products from Bank A in the past:

- A. Yes
- B. No

8. If you have purchased financial products from Bank A, your asset range is:

- A. 00,000
- B. 01,000-100,000 (inclusive)
- C. 100,000-500,000 (inclusive)
- D. 500,000-1,000,000 (inclusive)
- E. 1 million to 5 million (inclusive)
- F. More than 5 million

9. Would you like to buy a bank product:

- A. Yes
- B. Unwillingness

Part 2: Your opinion on Bank A's financial products

(Please select the corresponding degree according to your true perception and mark the

corresponding place with " ✓ ".)

| The type of question   | Specific questions                                                                                                                             | 1 strongly disagrees<br>2 Disagree<br>3 General<br>4. Agreed<br>5 strongly agree |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| Perceiving ease of use | In my opinion, Bank A has a wide selection of financial products, and you can buy products that meet your needs at any time                    |                                                                                  |
|                        | I think Bank A's app is very easy to use                                                                                                       |                                                                                  |
|                        | I think Bank A's system is very easy to operate                                                                                                |                                                                                  |
| Perceived usefulness   | I think that the financial information of Bank A is helpful for my personal wealth management                                                  |                                                                                  |
|                        | In my opinion, Bank A products can increase the return on assets                                                                               |                                                                                  |
| Comparative advantage  | Compared with the personal financial products of other banks, Bank A has more choices of financial products and is more convenient to purchase |                                                                                  |
|                        | Compared with other banks, Bank A's app will push more useful investment information                                                           |                                                                                  |
|                        | Compared with other financial products, Bank A's points mall prizes have advantages                                                            |                                                                                  |
| Perceived risk         | I am worried that Bank A will leak my personal privacy information                                                                             |                                                                                  |
|                        | I'm worried that Bank A will leak my personal transaction data                                                                                 |                                                                                  |
|                        | I am worried that Bank A's investment return will be low, and it                                                                               |                                                                                  |

|                                   |                                                                                      |  |
|-----------------------------------|--------------------------------------------------------------------------------------|--|
|                                   | will even bring the risk of loss                                                     |  |
|                                   | I'm worried that Bank A has high transaction fees                                    |  |
| Experience<br>and<br>satisfaction | In my opinion, Bank A's financial products are more personalized                     |  |
|                                   | Bank A's APP operation interface is more designed                                    |  |
|                                   | I am open to marketing related to financial products                                 |  |
|                                   | I think the activities and products in the point mall are useful                     |  |
|                                   | I feel that I am more sensitive to new financial products                            |  |
|                                   | I think that Bank A's after-sales service can provide me with a good user experience |  |
| Involvement                       | I usually pay attention to the dynamics of Bank A                                    |  |
|                                   | I usually log in to Bank A's app regularly                                           |  |
|                                   | I would love to participate in Bank A's activities                                   |  |
